ENGINEERING WAKELY COMPANY

THE WAKELY RUBBLE SEPARATOR

Once grain has been fed into the intake hopper it is augered into the angled rotating drum to the feed box below. The trash continues along to the end of the drum, where it is discharged using a different chute.

The Rubble Separator maximises the efficiency of your Roller Mill - not only does it remove trash but it also presents the product in a consistent manner. Travel & Discharge of Grain & Trash is controlled by spiral flights inside the Mesh. No useful grain discharged! Option of having an Aspirator to remove lighter particles.

SPECIFICATIONS

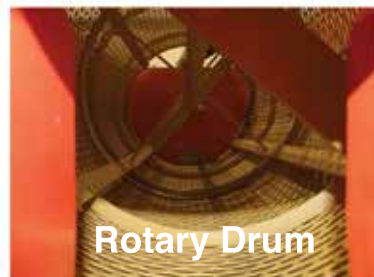

- 5 Separate models
- 2 Drum mesh sizes
- Inlet chute can be gravity or motor fed
- Convenient observation ports
- Magnet magazine removes ferrous material
- Single phase versions available
